

Improving Efficiencies Through Better Technology

Tuesday 8 April 3:45-5pm

Hilton New York

Gabe Minton, MBA

VP Industry Technology

Key Trends in the Industry

- Industry Trends:
 - Huge volume from refi boom
 - This is pushing the use of automated decisioning systems to new limits – primarily AUS
 - We continue to see consolidation both technically and operationally

Key Trends in the Industry

- Technology Trends:
 - Web service architecture becoming prevalent
 - Led by: Microsoft .NET, IBM, Sun Java
 - XML being used in almost every sector for almost everything
 - We continue to march towards eMortgages

Trend: A Common Web Services Architecture is Evolving

- Provides more sustainable (i.e. cheaper) software
- Allows end-user companies to achieve the software and infrastructure payback they require
- Provides foundation for a *service-oriented architecture*

Achieving Sustainable Business Benefits through a Common Web Service Framework

In this post-dot-com era, end user companies are expecting more liquidity and longevity of their assets.

*To achieve the ROI, Cost Reduction and Service Expansion benefits expected; the widespread deployment of **standards-based** Web services is essential.*

Translation: The drive to web-services starts bottom-up, with the software and vendors

Trend: XML is here to stay

- Core business value-add #1:
 - Your software interfaces can expand and contract without breaking anything
- Core business value-add #2:
 - XML software costs next to nothing and is omnipresent
 - MS Office 11 (now in beta) – all XML!
 - XHTML provides way to read and display data in browser
- MISMO provides the common business language for our vertical

Web services + XML =

- Faster interface build-out
 - Takes you 6 weeks instead of 6 months to start using new software or a new vendor
 - Easier to switch if you are not satisfied
- Vendors (like GHR and First American) offer multiple services through websites
 - No deployment, no application to install => thin or superthin client (i.e. runs in your browser)
 - New modules, services, and functionalities added overnight

Trend: eMortgages

- Legal Framework: E-SIGN Legislation
- A Range of Definitions Exists:
 - Paperless: All Documents in Electronic Form and Electronically Signed
 - Hybrid: Some Documents Signed Electronically, Some Traditionally Signed
 - Paper eMortgage: Originated Electronically, Traditionally Signed

MISMO's SMART Doc

- Business Viewpoint: an Electronic Representation of a Paper Document that:
 - Maintains Integrity and Security
 - Addresses Legal Concerns
 - Uses Non-proprietary Technology
 - Allows Data to be Processed by Systems
- Technology Implementation: an XML File

Security through digital certs

- Common need for digital certificates
 - A digital certificate is like a secure network identification of who you are. It can be used as a digital signature for digitally signing files
 - A digital signature is not a holographic signature (a common misunderstanding in the industry)
 - The three functions of standardized certificates are:
 - Authentication – telling if someone is who they say they are
 - Encryption – securing files as you send them across the net
 - Verification – checking if the contents of a file have changed

The most desired function of Digital Signatures?

- Verification!
 - You will be able to receive “tapes” or other data sets over the web/Internet that your machines can check for validity
 - The use of a digital signature combined with a file match, can verify if any SMART document has changed from the time it was sent to the time you received it
 - Therefore, you know that pool data is correct, you know this loan data is accurate, you can hedge without flying or shipping loan files around for checking –
Faster deals, increased efficiency, more volume

SMART Doc 1.0 Visualization

(Original Proof of Concept)

```
<DocType>note</DocType>
```

```
<BorrowerFirstName>Gabe  
</BorrowerFirstName>
```

Note:

I, **Gabe** promise to pay a lot of money

Digital Signature makes it tamperproof

Another SMART Doc

(Think: eLetter of Intent)

Standardized names and
definitions –
Maps view into data

View section -
What the trader
sees and signs

```
<DocType>poolsale</DocType>
```

```
<PurchaseLenderName>WAMU
```

```
</PurchaseLenderName>
```

Sale:

We, **WAMU** intend to
Purchase these
Loans: #1, #2...

Digital Signature makes it tamperproof

State of eMortgages

- They are real, but adoption is slow
- Are eMortgage systems live/in production?
Yes.
- How many eMortgages are closed? Over 100, but many may be refi'd out already 😊
- What are lenders doing? One step at a time, *crawl-walk-run*, based on ROI – electronic lien releases highlighted at Tech Show

The Future

- More Tech Consolidation – Superhubs
 - Hubs will continue to collapse to fewer in number and grow larger in size
- XML will become ubiquitous, even if all you use is MSOffice
- eMortgages are here to stay – it is a question of *when*, not *if* – hybrids will be first, paper will stay too
 - This leads to new opportunity and increased volumes in the secondary market
- Security will be more important then ever

Apply the Future to Secondary

- You will log into a couple of websites for all services needed: rates, diligence, auction, locking
- Dealmaking will be done on-line – ESIGN allows for online signatures – at least *intent* can be established in short term
- Common business terms already make reading reports, loan performance, and data easier then ever – e.g. you know “loan amount” **ALWAYS** includes MI
